

Collaborators - Week 2

Refactoring Detection Project - Team Contribution Summary

Purpose

This document summarizes who worked on each part of the Week 2 project progress. It is meant to be uploaded to the project website as a clear record of team collaboration and individual contributions.

Week 2 Progress Context

- The team continued from Week 1 by running and testing the AntiCopyPaster tool, reviewing log output, and collecting UI-relevant information.
- The team discussed the prototype direction, especially how to make it feel closer to IntelliJ and more useful for developers.
- The team explored confidence score ideas, including how usefulness, compilation, testing, and refactoring attempts could affect trust in a suggestion.
- The website was pushed to the new GitHub repository branch and is being used to track weekly progress and host files.
- The team continued organizing slides, reports, meeting notes, collaborators files, and shared resources through OneDrive and the website.

Week 2 Shared Work

- Everyone contributed to the Week 2 progress presentation and team discussions.
- Everyone attempted to understand or test the tool workflow and the problems encountered while running it.
- Everyone contributed to the UI improvement discussion in some way, including ideas related to loading states, error messages, confidence score, and refactoring attempts.
- Everyone continued using GitHub and shared files as part of the team workflow.

Individual Contributions

Team Member	Main Week 2 Contribution
Dhir	Worked on AntiCopyPaster code setup, UI improvement ideas, and the AI Trust Score section. He tried running the project locally through the ui_panel branch and tested the plugin in a sandbox IntelliJ environment. He also worked with Juliana on the confidence score task using a shared Google document. His work helped expand the idea from basic LLM confidence into an AI Trust Score that measures how safe and reliable a refactoring suggestion is. He helped develop the proposed formula using LLM confidence, clone detection confidence, usefulness, compilation result, tests/behavior preservation, and diff safety. He also added explanations, an example 94% score, and UI recommendations for expandable details and failure-state handling. Dhir also helped present the confidence score section.
Juliana	Participated in the weekly meeting with Dr. AlOmar and the development team, where the team discussed Dhir's prototype, IntelliJ-style UI direction, confidence score ideas, and running the tool. She searched for IntelliJ UI references and found a JetBrains Figma UI kit that could guide the prototype. She researched what an LLM confidence score is, how it can be calculated, and which methods might fit AntiCopyPaster. She summarized useful sources into a PDF and shared it with the team. Juliana also attempted to run the tool, worked through the ZIP/setup process, added it to IntelliJ, and investigated the Gemini API key issue. She helped develop and present the confidence score section, and she prepared the Week 2 meeting notes file.
Jake	Attempted to run the program throughout the week and reached the same API key issue as other team members. Since the code could not fully run because of the API problem, he still contributed UI ideas based on the screenshots, examples, and expected workflow. His suggestions included adding a loading screen, clearer error messages, and a way to show how many refactoring attempts the tool has made. Jake presented the UI improvement discussion slide.
Fintan	Attempted to run the code on his system to gather more information about the tool and its behavior. He contributed ideas for improving the UI, especially around how AI confidence or trust could be represented to the user. He also helped assess the week's shortcomings and identify what the team should improve going forward. Fintan presented the code testing, log review, and issues-related slides.

Team Member	Main Week 2 Contribution
Amaro	Attempted the same tool-running and UI-idea work as Jake and Fintan, including thinking about UI improvements from the problems encountered during testing. He created the Week 2 slide template, worked on the presentation structure, and presented slides 1-4 and 10. He also updated and maintained the Summer Research Website, including the progress-tracking structure and the files hosted there. Amaro prepared the website-related files such as the report, collaborators file, and other weekly documents, excluding the notes file prepared by Juliana. He is also in charge of keeping the website updated each week.

Presentation Responsibilities

- Amaro presented slides 1-4 and 10, covering the weekly overview, website/files, and next steps.
- Fintan presented slides 5, 6, and 7, covering code testing, log review, and issues encountered.
- Jake presented slide 9, covering UI improvement ideas such as loading screen, error pop-ups, refactoring attempts, and API key format.
- Juliana contributed to slides 7 and 8, especially the confidence score and setup/tool issues discussion.
- Dhir contributed to slide 8, especially the AI Trust Score section and proposed confidence score formula.

Progress Areas Covered in the Slides

- Weekly progress summary: code testing, log review, website updates, UI design, confidence score, and GitHub/file organization.
- Website and weekly files: hosted progress website, slide files, meeting notes, reports, collaborators files, and OneDrive organization.
- Code testing and log review: running the project, testing the tool, reading logs, and collecting information that can improve the UI.
- Issues encountered: API key format problems, Gemini API permission/API-call errors, and IntelliJ usability issues.
- Confidence Score section: AI Trust Score formula and explanation of how confidence should reflect safety, usefulness, compilation, tests, and diff safety.
- UI improvement discussion: loading screen, error pop-ups, refactoring attempts, confidence display, and API key validation updates.

Summary

Overall, Week 2 focused on moving from project understanding into hands-on testing, UI improvement planning, and confidence-score research. Even though the team encountered setup and API key issues, everyone contributed by testing, documenting problems, brainstorming design improvements, preparing slides, and organizing files for the progress website.
