

First Meeting Notes

Research meeting with Dr. AlOmar - Monday, May 18, 2026

Meeting Focus

The main goal of this first meeting was to understand the project, divide the first tasks, and prepare the team for the next progress update.

- Get familiar with the project code and overall system structure.
- Understand the provided paper, especially Section 4, which explains the system workflow and agents.
- Review the agent folders in the codebase and understand the role of each agent.
- Start thinking about UI improvements after understanding how the program works.
- Prepare a progress presentation and organize work for the next meeting.

Technical Setup and Tools

- Run and test the project using IntelliJ IDEA 2024 or 2025.
- Share GitHub usernames in Discord so everyone can access the repository.
- Get familiar with GitHub basics: branches, pull, push, commits, and collaboration workflow.
- Use GitHub to organize code, design work, and team progress.

Team Tasks

Task	Area	Description
Task 0.5	Before the team meeting	Divide into two groups. Three people read the code and explain it in simple terms. The other two work on the design presentation and prototype.
Task 1	Design alignment	Create a short and fun mini presentation video for the team about the target audience, what the design should include, and an initial prototype.
Task 1.5	Prototype discussion	After both presentations, combine the information and choose a first prototype direction to start coding and present to the professor.
Task 2	Progress presentation	Create a slide template and lead the presentation. If a prototype is chosen, split into two groups: one for overall implementation and one for the buttons/actions. Present whatever progress is ready.
Task 3	Progress website	Individually start building a website to track progress. Use previous examples as inspiration, but aim to make a better version.
Task 4	Final preparation	Gather the week's work into a report and add it to the slideshow for the professor meeting.

Design and Prototype Work

- Understand the program before deciding on the UI design.

- Focus the design on the target audience: Java developers and students who need clear and trustworthy refactoring suggestions.
- Create prototypes that explain what was detected, where the duplicate code is located, what change is suggested, and why the user can trust it.
- Compare the prototypes and choose the strongest design direction on Friday.

Presentation Preparation

- Prepare slides showing the weekly progress and meeting outcomes.
- Include what the team learned from the paper and code review.
- Explain the different agents in simple terms.
- Show the selected UI prototype and explain why the team chose it.
- Add the report and slides to the progress website.

Immediate Next Steps

- Finish GitHub setup and make sure all team members have access.
- Complete the team explanations for the main agents.
- Finalize the first prototype direction.
- Prepare the progress slides and report for Monday.
- Start building the progress tracking website.
