 **[CLONE] Refactoring Suggestion**

CLONE found a Type-1 in this file.

The pasted code in ``org.jhotdraw.contrib.Helper#getDrawingView`` starts on line 19 and matches existing code in ``org.jhotdraw.contrib.Helper#getDrawingView_cloned`` starting on line 37.

Suggested refactoring:

Extract the shared calculation logic into a new helper method named a new method named ``findDrawingViewInContainer``.

This would replace both duplicate code blocks with calls to the new method, reducing repeated code while keeping the same behavior.

Verification status:

CLONE is checking usefulness, isolated compilation, and tests.

The Apply button will stay disabled until verification passes.

Diff: Extract Method ``findDrawingViewInContain..``

Pasted Location: [Helper.java:19 \(org.jhotdraw.contrib.Helper#getDrawingView\)](#)

Clone ID: clone_1_selected

Target Methods: `org.jhotdraw.contrib.Helper#getDrawingView <-> org.jhotdraw.contrib.Helper#getDrawingView_cloned`

Suggested Refactor: extracted_method

Selected Ranges: 19-34, 37-52

Detection Reason: The pasted snippet (lines 21-33) and the body of `getDrawingView_cloned` (lines 39-51) are structurally identical, differing only in the enclosing method name. All three panelists agree this is a clone.

Verification: Usefulness check, isolated compilation, and tests are running.

4. Overlap with text

This would replace both duplicate code blocks with calls to the new method, reducing repeated code while keeping the same behavior.

Verification status:
CLONE is checking usefulness, isolated

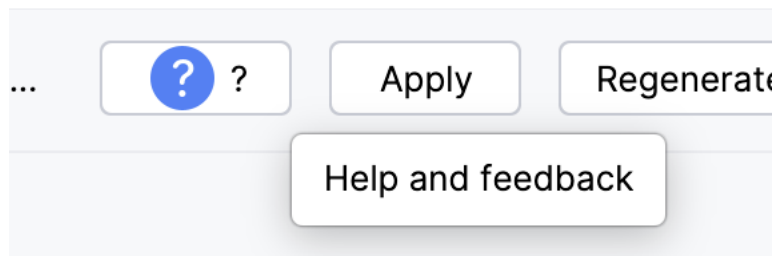

5. In Edit, the target clone methods show missing in proposed source

Make any changes to the refactored code below, then click "Use This Code" to apply your edited version instead of the original suggestion.

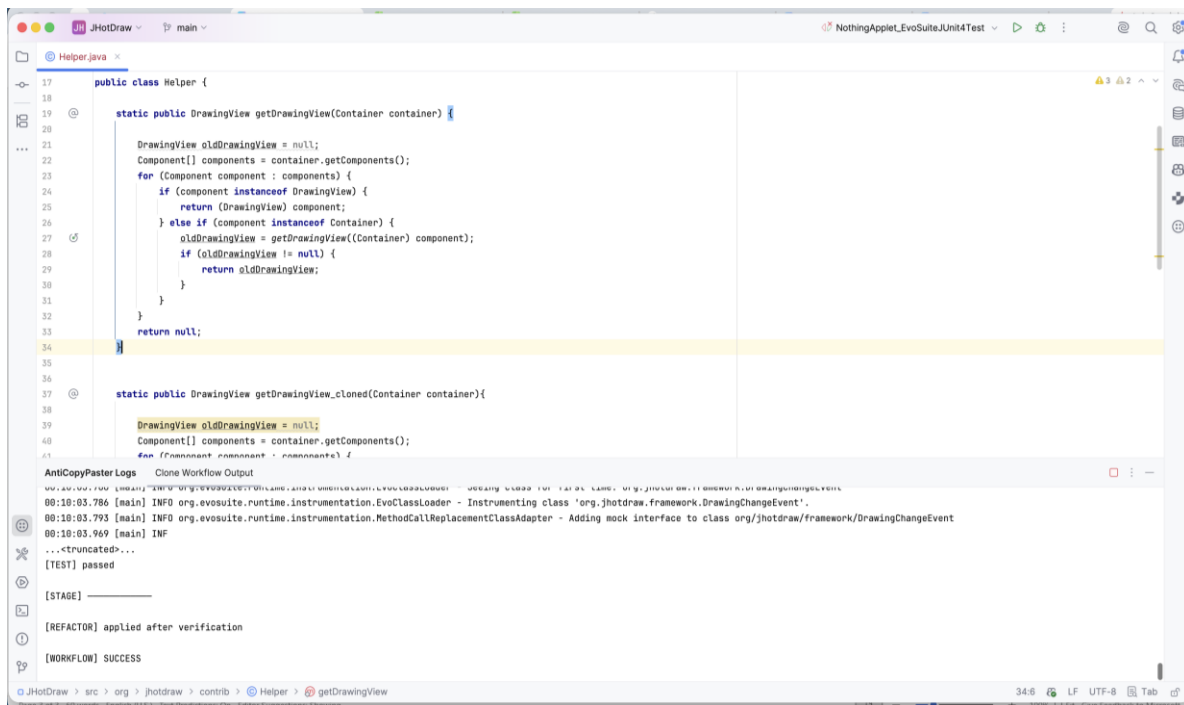

```
// Target clone methods
// Missing in proposed source: org.jhotdraw.contrib.Helper#getDrawingView
// Missing in proposed source: org.jhotdraw.contrib.Helper#getDrawingView_cloned

// New helper methods
// org.jhotdraw.contrib.Helper#findDrawingViewInContainer
private static DrawingView findDrawingViewInContainer(Container container) {
    DrawingView oldDrawingView = null;
    Component[] components = container.getComponents();
    for (Component component : components) {
        if (component instanceof DrawingView) {
            return (DrawingView) component;
        } else if (component instanceof Container) {
            oldDrawingView = findDrawingViewInContainer((Container) component);
            if (oldDrawingView != null) {
                return oldDrawingView;
            }
        }
    }
    return null;
}
```

6. Help and feedback should not link to the github

7. When i click apply, the code does not change

- The UI feels very cramped. All the information is packed into a single view, making it difficult to read and navigate. There is also no scroll bar, so part of the content may become inaccessible when the window size is limited.
