

# Collaborators - Week 7

## Refactoring Detection Project - Team Contribution Summary

### Purpose

This document summarizes the team collaboration and individual contributions completed during Week 7. It is intended for the project website as a clear record of UI refinement, research-paper writing, testing preparation, and weekly project organization.

### Week 7 Progress Context

- The team moved from feature implementation and branch integration into final UI refinement, full-panel verification, and research-paper development.
- Eight of eleven identified UI issues were fixed, including layout, spacing, scrollbars, labels, help-button cleanup, and the Details & Provenance dropdown icon.
- The project name shown in the interface was updated from AntiCopyPaster to CLONE where needed so the panel uses the final project identity consistently.
- The team learned how to work with Overleaf and began writing the final paper, including the abstract, introduction, problem statement, new-features sections, and feature-specific subsections.
- The website and OneDrive files continued to be updated so weekly progress, reports, notes, and screenshots remain organized.

### Week 7 Shared Work

- Everyone contributed to the final report by writing or supporting the subsection connected to their own UI feature.
- The team discussed the remaining UI issues and planned another full run of the plugin after purchasing additional API tokens.
- Team members prepared screenshots, recordings, and feature explanations that can be added to the New Features section of the paper and the project website.
- Everyone continued reviewing the full CLONE workflow so the final interface and written report accurately explain how the plugin works and why each UI improvement matters.

## Individual Contributions

| Team Member    | Main Week 7 Contribution                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Amaro</b>   | Continued managing the project website and weekly files, including reports, meeting notes, collaborators documents, and file uploads. For the final paper, he worked on the Header and Abstract and wrote the Problem Statement, explaining the limitations of earlier CLONE interfaces and the purpose of the new design. He also continued work connected to the Explanation section and helped organize the team's written contributions. Amaro coordinated with Juliana on purchasing API tokens so the team could run the complete plugin again, verify the latest panel, collect screenshots, and prepare material for the website and paper. |
| <b>Jake</b>    | Worked on the Introduction section of the final paper. His contribution explained why CLONE is important, how the plugin works at a high level, and how the report is organized. He also contributed the short New Features explanation for his Multiple Clone Dialog work, describing how the popup helps users review and decide on clone occurrences separately instead of treating every detected clone as one combined action.                                                                                                                                                                                                                 |
| <b>Juliana</b> | Continued supporting the Diff Preview section and planned the final verification run with Amaro using additional API tokens. She prepared to record a complete run of the tool so the team could add the video to the website and capture light-mode screenshots for the New Features section of the report. She also agreed to help Fin resolve the remaining button issues and contributed the Diff Preview subsection, explaining how the redesigned cards make the proposed refactoring easier to read and compare.                                                                                                                             |
| <b>Dhir</b>    | Led the New Features section of the Overleaf paper and helped organize how each feature should be documented. He wrote and refined the AI Trust Panel subsection, explaining the overall trust score, the five equally weighted validation stages, and the verified, pending, and failed states. His work connected the implemented interface to the paper by clearly explaining why the trust breakdown improves transparency and helps developers understand whether a suggestion is safe to apply.                                                                                                                                               |
| <b>Fin</b>     | Focused on the remaining button issues and planned to fix them with Juliana's help. He documented the Action Buttons subsection for the final paper, including the improved Edit action, the situations in which Apply should remain disabled, and the human-in-the-loop workflow. His contribution explains why the user must remain in control of whether a suggestion is edited, applied, rejected, or reviewed in more detail.                                                                                                                                                                                                                  |

## Final Paper Responsibilities

| Paper Section                    | Primary Contributor |
|----------------------------------|---------------------|
| Header and Abstract              | Amaro               |
| Introduction                     | Jake                |
| Problem Statement                | Amaro               |
| New Features coordination        | Dhir                |
| Multiple Clone Dialog subsection | Jake                |
| Explanation subsection           | Amaro               |
| Diff Preview subsection          | Juliana             |
| AI Trust Panel subsection        | Dhir                |
| Action Buttons subsection        | Fin                 |

## Testing and Documentation Plan

- Amaro and Juliana planned to purchase additional API tokens so the latest full panel could be run and verified again.
- Juliana will record the plugin running and send the recording to the team for the website.
- The team will capture screenshots of each new feature in IntelliJ light mode and place them in the correct Overleaf subsections.
- Each member should briefly explain their own UI change and why it matters so the New Features section reflects the full team contribution.
- Fin and Juliana will work together on the remaining button issues before the final verification run.

## Summary

Overall, Week 7 focused on polishing the integrated CLONE interface and turning the team's implementation work into a clear final paper. Each member contributed to the subsection connected to their feature, while the team also prepared for a final full-panel verification using additional API tokens. The work was collaborative and balanced: members documented their own feature, supported remaining UI fixes, prepared visual evidence, and continued keeping the website and research materials organized.
