

Eighth Meeting Notes

Research meeting with Dr. AlOmar - Week 7

Meeting Focus

The main goal of the eighth meeting was to review the latest UI fixes, present progress on the Overleaf research paper, and prepare for user testing of the updated CLONE plugin. The team also discussed the remaining technical issues, the need for clearer documentation, and how feedback from outside users will be collected and included in the final report.

- Presented the latest UI fixes and improvements made to the CLONE panel.
- Showed the progress completed on the Overleaf research paper.
- Reviewed a paper shared by Dr. AlOmar that may be used as a reference for the team's final paper.
- Discussed recruiting users to test the CLONE plugin with the new UI panel.
- Reviewed a feedback form that test users can complete after using the plugin.

Main Updates from the Meeting

Topic	Notes
UI fixes	The team presented the latest fixes to the CLONE interface and reviewed the current state of the updated panel.
Overleaf progress	The team showed the sections already added to the research paper and discussed where more detail is still needed.
Reference paper	Dr. AlOmar shared a paper that can help guide the structure, wording, and presentation of the team's final paper.
User testing	The team discussed finding users who can install and test the CLONE plugin with the redesigned UI panel.
Feedback form	Dr. AlOmar provided a form for test users. The team will revise the questions so the responses can be analyzed and shown in the report.

Tasks for the Week

Area / Owner	Task
Team	Fix the final three remaining UI issues and confirm the corrected panel works as expected.
Overleaf	Expand the existing subsections because the new-features sections are still too brief.
Workflow documentation	Add a workflow section explaining how the CLONE plugin works from clone detection through refactoring, validation, and user action.
How-to-use documentation	Add a step-by-step section explaining how to install, configure, and use the CLONE plugin.
Figures	Add images of every new feature in IntelliJ light mode and place each figure in its corresponding subsection.
Each team member	Find two to three users to test the plugin and complete the feedback form.
Feedback form	Edit the Google Form questions so the responses provide useful feedback that can later be summarized in graphs for the final report.

Overleaf and Paper Direction

- Use the reference paper from Dr. AlOmar to improve the organization and level of detail in the final report.
- Expand the new-feature subsections so each feature explains its purpose, design, implementation, and benefit to developers.
- Add a workflow section that explains the full CLONE process in a clear order.
- Add a practical installation and usage guide so readers can reproduce the setup and understand how to use the plugin.
- Include clear figures in IntelliJ light mode for the multiple clone dialog, explanation section, diff preview, AI Trust panel, action buttons, and full interface.

User Testing Plan

The team will begin gathering feedback from users who were not directly involved in development. Each member should recruit two to three participants, ask them to test the CLONE plugin with the new panel, and have them complete the updated Google Form. The results will be reviewed as a team and converted into graphs or summary figures for the final paper.

Recommended Feedback Areas

Feedback Area	What the Team Should Learn
Clarity	Whether users understand what clone was found, where it is located, and what refactoring is being suggested.
Diff preview	Whether the before-and-after code comparison is easy to read and useful for making a decision.
AI Trust	Whether the trust score and validation stages make the suggestion feel more understandable and reliable.
Multiple clones	Whether separate clone cards and individual choices are clear when more than one clone is detected.
Actions	Whether Apply, Edit, Reject/Cancel, Open in editor, and View Details behave as users expect.
Overall usability	Whether the panel feels natural inside IntelliJ and whether users would feel comfortable using it during development.

Immediate Next Steps

- Complete and test the final three UI fixes.
- Expand every Overleaf subsection and add the workflow and how-to-use sections.
- Capture light-mode images of each feature and the full panel.
- Revise the Google Form so it collects clear, measurable feedback.
- Each member recruits two to three users to test the plugin.
- Organize the responses and create graphs for the final report.
- Continue updating the website and shared project files.

Summary

Overall, the eighth meeting moved the project into its final refinement and evaluation stage. The team presented the newest UI fixes, reviewed progress on the paper, received a useful reference from Dr. AlOmar, and planned formal user testing. The next focus is to finish the remaining technical issues, strengthen the Overleaf paper with more detailed explanations and figures, and collect user feedback that can be analyzed and included in the final report.
