

Third Meeting Notes

Research meeting with Dr. AlOmar - Monday, June 1, 2026

Meeting Focus

The main goal of this meeting was to present the team's second-week progress, review issues found while trying to run and test the tool, and clarify the next direction for the UI panel, confidence score, and trust score work.

- Presented the Week 2 progress slides to summarize the team's work.
- Discussed issues encountered while using and testing the AntiCopyPaster tool.
- Reviewed the UI Panel as the starting point for UI development; it was added to GitHub.
- Discussed how the confidence and trust score should be changed based on Dr. AlOmar's suggestions.
- Planned the next steps for improving the UI panel and organizing task division.

Main Updates from the Meeting

Topic	Notes
Week 2 presentation	The team presented the second week's slides, including progress on the website, code testing, log review, UI ideas, and confidence score work.
Tool issues	The team discussed issues that came up while trying to use and test the tool, including setup and API key problems.
UI Panel	The UI Panel was identified as the starting point for UI work and was added to the GitHub repository.
Confidence and trust score	Dr. AlOmar suggested adjusting the formula and separating the different validation components instead of relying on model confidence.
Logs	The team should check the log file for useful information or scores from the calculator that could support the confidence score.

Dr. AlOmar's Suggestions on Confidence and Trust Score

- Remove diff safety from the formula.
- Exclude model confidence from the score.
- Focus on separate validation parts: clone detection, refactoring, refactoring usefulness, compilation, and testing behavior.
- Consider whether refactoring and refactoring agents should be combined or represented together more clearly.
- Use information from the log file and calculator outputs when deciding what should be shown in the confidence score.

Tasks for the Week

Owner	Task
Team	Send Amaro each team member's summarized weekly progress and completed tasks.
Team	Read the sample log file provided by Dr. AlOmar on Discord.
Team	Start working on improving the UI panel on GitHub and divide the implementation tasks.
Juliana	Send a screen recording of the errors and warnings that appear when duplicating a method while testing the tool.
Juliana and Dhir	Update the confidence and trust score based on Dr. AlOmar's suggestions.
API key fix	Change the validation so it accepts the AQ. prefix, or remove API key validation completely.

UI Panel and Implementation Direction

- Use the existing UI Panel as the base for the next design and implementation work.
- Make the interface more similar to IntelliJ so it feels familiar to developers.
- Improve how errors and warnings are shown to users when the tool cannot complete the refactoring process.
- Use testing and log information to decide what details should appear in the UI.
- Begin dividing work so the team can start making concrete UI changes on GitHub.

Immediate Next Steps

- Collect weekly progress summaries from each team member.
- Review the sample log file and look for useful information for the UI and confidence score.
- Record and document tool errors during testing.
- Update the confidence and trust score formula based on the new requirements.
- Fix or remove the API key validation issue.
- Start improving the UI panel and divide tasks across the team.

Summary

Overall, this meeting moved the project from general research and prototype planning toward implementation. The team now has a clearer starting point for the UI through the UI Panel, a better direction for the confidence and trust score, and specific tasks for testing, log review, API key fixes, and UI improvements.
