

Other Docs

Organized raw log files used for UI design process

Purpose: keep the original log evidence in one clean document.

These logs were used to understand what the UI should show to the developer: stages, clone ranges, attempts, errors, validation results, and failure messages.

The content below is intentionally close to the raw logs, but organized into sections with headers.

Included Sections

1. User-provided quota note - Manually pasted note from team member about exceeding Gemini quota/tokens.
2. RockPaperScissors Gemini log - Raw log file uploaded as message.txt. Main issue: Gemini quota/resource exhaustion during detection and refactoring.
3. AprLifecycleListener DeepSeek log - Raw .log file generated when running AntiCopyPaster with DeepSeek on AprLifecycleListener.java.
4. Running the tool + Log file - Text extracted from the uploaded PDF. Includes test notes, clone example, stages, quota errors, usefulness results, compilation, and testing output.

Section 1: User-provided quota note

Manually pasted note from team member about exceeding Gemini quota/tokens.

Raw organized content

```
[LLM_REFACTOR] [Refactoring Panelist 2] exception: RuntimeException: Gemini error 429: {
  "error": {
    "code": 429,
    "message": "You exceeded your current quota, please check your plan and billing details. Quota exceeded for input
      tokens and requests. Please retry later.",
    "status": "RESOURCE_EXHAUSTED"
  }
}
```

Section 2: RockPaperScissors Gemini log

Raw log file uploaded as message.txt. Main issue: Gemini quota/resource exhaustion during detection and refactoring.

Raw organized content

```
[LOG] writing to .anticypaster/logs for file=RockPaperScissors.java, model=gemini-3-pro-preview

[START] RockPaperScissors.java

[PASTE] snippet provided (chars=162): switch (result) {\n
    case "You win!" -> playerWins++; \n
    case "CPU wins!" -> cpuWins++; \n
    default -> ties++; \n
}

[SETTINGS] maxAttempts=3, minimumCloneCount=2

[LLM_SETTINGS] provider=Google, model=gemini-3-pro-preview, apiKey=AQ...vvQ

[START] RockPaperScissors.java

...<truncated>...
[TEST] passed

[STAGE] -----

[REFACTOR] verified but not applied (user cancelled)

[WORKFLOW] SUCCESS

```

Section 4: Running the tool + Log file

Text extracted from the uploaded PDF. Includes test notes, clone example, stages, quota errors, usefulness results, compilation, and testing output.

Raw organized content

```

1st test: Failed due to API Key misunderstanding
2nd test: Tool ran but ran out of tokens very quickly with the gemini-3.1-flash-lite-preview
Code clone:
for(int i = 0; i < radius; i++){
int j = height + length;
}

```

Highlights:

- Refactoring in attempt 1 for my specific copy+paste NOT RECOMMENDED after clone was identified

Reason:

UNKNOWN

The refactoring does not properly remove duplication or introduce a correct shared abstraction. Please ensure both clones delegate to a newly extracted helper method.

- Exceeded current quota for tokens after attempt 1, even compilation still was successful in attempts 2 and 3. Tests failed soon after due to the LLM being unavailable. Three consecutive 429 errors thrown.

Compilation successful: Ready to run (attempt 2) for: Main.java

[Clone] Tests failed (attempt 2) for: Main.java

Six consecutive 429 errors (Quota exceeded)

Compilation successful: Ready to run (attempt 3) for: Main.java

[Clone] Tests failed (attempt 3) for: Main.java

[Clone] Workflow failed after 3 retries for: Main.java

Output log - 2nd test:

Key:

```

. : Log initialized
. : Stage 1/3
. : Stage 2/3
. : Stage 3/3
. : Final output - failure

[STAGE] -----
[ATTEMPT] 2/3
[STAGE] REFACTORING STAGE (attempt 2/3)
[REFACTOR] retry mode: feedback-only prompt
[FEEDBACK] sending feedback to refactor agent (mode=feedback-only):
Your previous refactoring attempt was rejected by the usefulness
checks.
[NOT_USEFUL_REFACTORED_CODE]
``java
// Target clone methods
// Missing in proposed source: Main#main
// New helper methods
// Main#calculateSum
private void calculateSum(int count, int h, int l) {
for (int i = 0; i < count; i++) {
int j = h + l;

```

```

}
},
[LLM_USEFULNESS]
Curator decision: NOT_USEFUL
Reasons: [EXTRACTION_WITHOUT_CLONE_REPLACEMENT_DETECTED]
Summary: The refactoring created a helper method but failed to replace
the original redundant code blocks in Main#main with calls to the new
method.
Feedback: Update Main#main to remove the duplicated loop blocks and
replace them with calls to the newly created calculateSum method.
Confidence: 1.00
Notes: panelists=3,
P1=not_useful[EXTRACTION_WITHOUT_CLONE_REPLACEMENT_DETECTED],

```

```

--- page break in extracted source ---
P2=not_useful[EXTRACTION_WITHOUT_CLONE_REPLACEMENT_DETECTED],
P3=not_useful[EXTRACTION_WITHOUT_CLONE_REPLACEMENT_DETECTED],
curator=not_useful[EXTRACTION_WITHOUT_CLONE_REPLACEMENT_DETECTED],
confidence=1.00
[REASONS]
[FRAGMENT_TOO_SMALL]
[STRATEGY]
UNKNOWN
[REASON_DEFINITION]
The refactoring does not properly remove duplication or introduce a
correct shared abstraction. Please ensure both clones delegate to a
newly extracted helper method.
[USEFULNESS_NOTES]
minTokenCount=13 (<20)
[REVISION_INSTRUCTION]
Update Main#main to remove the duplicated loop blocks and replace them
with calls to the newly created calculateSum method.
Additional PSI guidance:
Your refactoring is not useful. You must actually remove or
significantly reduce the duplicated fragment in BOTH places. Avoid
incomplete refactoring, deleting one side, or delegating only one
side.
