

Fourth Meeting Notes

Research meeting with Dr. AlOmar - Monday, June 8, 2026

Meeting Focus

The main goal of this week was to review the team's Week 3 progress, confirm that the tool could be run by all members, finalize the UI design direction, and begin moving from design planning into UI panel implementation.

- Presented the Week 3 progress slides to summarize the team's recent work.
- Confirmed that all members were able to run the AntiCopyPaster tool, with the main remaining issue being API token limits.
- Finished the UI design using the IntelliJ Figma Kit so the prototype matches the IDE style more closely.
- Reviewed the updated Confidence/Trust Score work completed by Dhir.
- Planned the next UI tasks: handling more than one clone, reviewing the current UI Panel with runIDE, and dividing implementation work.

Main Updates from the Professor Meeting

Topic	Notes
Week 3 presentation	The team presented the third week's slides, including progress on tool testing, UI redesign, log review, and the AI Trust Score direction.
Tool running	All members were able to run the tool. The main issue that remained was related to API tokens and provider limits.
UI design	The UI design was finished using the IntelliJ Figma Kit, giving the prototype a more familiar IntelliJ-style layout.
Confidence / Trust Score	The score was updated by Dhir into the AI Trust Score direction based on workflow evidence such as clone detection, usefulness, compilation, and testing.
Implementation direction	The next step is to begin adding the design ideas into the UI Panel and divide tasks so everyone has a specific part to implement.

Tasks from Dr. AlOmar

Area	Task
UI cases	Add UI support for given cases, especially when the tool detects more than one clone.
Current UI review	Use runIDE to see what the current UI Panel looks like and compare it with the Figma design.
Demo reference	Use the demo video sent by Dr. AlOmar on Discord to understand the current behavior of the tool.
Task division	Divide UI implementation tasks so each team member owns a clear section of the design.

Team Meeting Summary - UI Implementation Planning

During the Wednesday team meeting, the team focused on how to begin implementing the UI Panel and how to divide the work in a way that is organized and easy to merge later.

Main Goals Discussed

- Add UI support for the cases shown by the tool and logs, especially the case where there is more than one clone.
- Use runIDE to inspect the current UI Panel and understand what is already implemented.
- Use Dr. AlOmar's demo video as a reference for how the tool currently behaves.
- Divide the UI implementation work so each member has a clear and manageable section.

What the Team Decided

Decision	Details
Starting point	The current UI Panel branch will be used as the starting point for implementation.
runIDE review	Everyone should run the project with runIDE to understand the existing UI Panel. If possible, one team member should send screenshots or a screen recording of the current UI.
Design comparison	The team will compare the current UI with the Figma design and decide what can realistically be implemented first.
Important UI sections	The UI should keep the explanation section, diff preview, AI Trust / validation section, action buttons, and details/provenance section.

Multiple Clone Decision

The team decided that when the tool finds more than one clone, the UI should show each clone in a separate card instead of combining every result into one section. This gives the developer more control and makes each refactoring suggestion easier to understand.

- Each clone card should represent one specific clone or refactoring suggestion.
- Each card should show the clone location, line numbers, short explanation, suggested Extract Method refactoring, AI Trust / validation status, and action buttons.
- The UI should ask the user individually if they want to refactor each specific clone.
- The user should be able to apply, reject, or inspect each clone separately instead of being forced to refactor all clones at once.

Multiple Clone Flow

More than one clone found -> show separate clone cards -> user reviews each card individually -> user chooses Apply / Reject / View Details for each specific clone.

GitHub Workflow Decided

The team decided to use separate branches and pull requests so implementation work can be reviewed before it is merged into the shared UI Panel branch.

- Each person works on their own branch for their assigned UI section.
- When the work is ready, that person pushes the branch to GitHub and opens a pull request into the ui_panel branch.
- The team reviews the pull request, checks for conflicts, and then merges it into ui_panel if it is accepted.
- After a pull request is merged, everyone should update their local ui_panel branch with the latest changes.

Implementation Direction

- Start with the existing UI Panel as the base for implementation.
- Compare the current UI Panel with the finished Figma design before making larger changes.
- Use screenshots or screen recordings from runIDE to understand what is already available in the UI.

Suggested Implementation Task Division

Team Member	Assigned UI Section
Jake Stinton	Multiple clone UI: implement separate clone cards and allow the user to decide on each clone individually.
Amaro da Luz	Explanation section: show clone type, file location, pasted code location, line numbers, and suggested method.
Juliana	Diff preview: show original duplicate code and extracted replacement.
Dhir Rana	AI Trust / validation section: show Clone Detection, Refactoring Agent, Usefulness, Compilation, and Test / Behavior status.
Fin Naughton	Buttons/actions: Apply, Reject/Cancel, Open in editor, View details, and disabled Apply state when validation fails.

Immediate Next Steps

- Each member should confirm their assigned section and create their own branch.
- Everyone should start working on their section and share progress before the next meeting.
- If someone is able to use runIDE, they should take screenshots or a screen recording and send it on Discord.
- The team should compare the current UI Panel with the Figma design before making larger implementation changes.
- Continue updating the weekly website files so the project progress stays organized.

Summary

Overall, Week 4 moved the project from completed UI design into implementation planning. The team confirmed that the tool can be run by all members, finished the IntelliJ-style UI design, updated the trust score direction, decided how multiple clones should be displayed, and divided the UI implementation work into clear sections. The next focus is to begin building these sections on separate branches and merge reviewed work into the ui_panel branch.
